

Presenting... the musical windshield

Just because you can't see a radio antenna on the fender of this 1969 car, doesn't mean there isn't one.

L-O-F put it in the windshield. And the reception is excellent from the beat to Bach.

The musical windshield is just one example of the way we combine materials to give them

new usefulness. Another is an optional rear window for this same car. It has a heating element built in. You push a button to get rid of fog.

This capability not only adds new dimensions to the products we supply our traditional markets—automotive and building—but it is leading us

into new fields.

Today L-O-F glass products are also in farm machinery, office copiers, television, education, defense, even aerospace.

And we figure to be in a lot more markets in the future. Libbey-Owens-Ford Company, Toledo, Ohio 43624.
